Fafnir's Artificial Intelligence (AI) policy:

Fafnir discourages the use of large language models (LLMs) or generative AI in preparing manuscripts for submission to the journal. While LLMs can expedite parts of the writing process, they are not capable of creativity or critical thinking. Additionally, we ask authors to be mindful of the environmental impact of LLMs and refrain from using them unnecessarily.

Obligatory disclosure:

Authors are obligated to disclose the use of AI tools for manuscript preparation in an AI declaration statement included in the manuscript upon submission. The statement will appear in the published article. The statement must include:

1. The name and model designation of the AI tool used.
2. An accurate description of how the tool was used.
3. An accurate description of which part of the manuscript was affected.
4. An acknowledgement by the author(s) that they have reviewed and edited the content where needed and take full responsibility for everything in the published article.

AI disclosure statements are not counted toward the manuscript character limit.

Exceptions to the obligation to disclose:

Basic checks of grammar, spelling and punctuation are excepted from the obligation to disclose AI use. However, authors must take care in distinguishing between basic checking and AI assisted writing: *changes to e.g. sentence structure, substance, organization of text, or rhetoric must be disclosed in all cases.*

Uses of AI tools within disability-related assistive technology do not need to be disclosed, provided they are solely for accessibility purposes.

If AI is used as part of a study design, it does not need to be disclosed but must be explained in detail in the methods -section of the article.

Prohibited uses of AI

Fafnir does not accept manuscripts based on substantially AI generated content. This refers to manuscripts containing text generated wholesale through use of LLMs rather than edited with their help. This also includes any manuscripts that contain research arguments and/or analyses generated by AI models and passed off as the authors' own.
